

## Growth Advanced Transplantation

The most advanced hair  
transplant technique

## G.A.T. (Growth Advanced Transplantation)

**Hair transplantation** is the only permanent medical solution for the treatment of **Androgenetic Alopecia**, the most common type of hair loss. As opposed to the results of former techniques, modern hair transplantation can accomplish a completely natural aesthetic result that is absolutely undetectable, provided they are performed by specialized, experienced doctors who possess all the necessary skills.

Aiming to enhance hair transplantation results, **Bergmann Kord** applies hair transplantations combined with the **PRP method (Platelet Rich Plasma)**, as the utilization of **Growth Factors** contributes essentially, in every way during the whole process of the hair transplantation.

The most modern and state-of-the-art hair transplantation is performed by removing hair follicles from the back of the head (donor area) and implanting them to the area presenting hair loss. Given that transplantation of new hair allows growth similar to how it would naturally, we can achieve a totally natural aesthetic result.

## Hair transplantation techniques

The most modern techniques for hair transplantation are:

The **FUT (Follicular Unit Transplantation)** & the **FUE (Follicular Unit Extraction)**, they differ mainly on the method utilized to extract the follicular units selected for transplantation.

The appropriate hair transplant technique for any interested party is chosen after evaluation of their demands and special characteristics (type of hair loss, degree, donor area potential, etc.). Its success depends upon the experience and the specialization of the medical team.

Our clinic implements all the internationally available techniques. The experts recommend the proper technique depending on the case and needs of the interested party.

## FUE (Follicular Unit Extraction)

**FUE** is implemented by extracting follicular units from the back and sides of the scalp and then re-implanting them to the area affected by hair loss. It can reproduce natural hair growth, as transplanted hair re-grows in its natural occurring groups of 1-4 hairs. When implemented by physicians with high surgical skills & highly developed aesthetic perception, FUE can accomplish refined & undetectable aesthetic results.

FUE has eliminated the need for a linear incision and allows hair transplant doctors to perform Follicular Unit Hair Transplantation through single & direct harvesting of the follicular units.

## FUT (Follicular Unit Transplantation)

Follicular Unit Transplantation (FUT) concerns the receiving of the follicular units through strip excision (single strip harvesting and stereomicroscopic dissection).

Follicular Unit Transplantation reproduces natural hair growth, as transplanted hair re-grows in its natural occurring groups of 1-4 hairs. When implemented by physicians with high surgical skills & highly developed aesthetic perception, FUT (Strip) refined & undetectable aesthetic results are accomplished.

## Basic information for hair transplantation

- The hair transplantation procedure is performed by Bergmann Kord's experienced medical team which includes a head surgeon, an anesthesiologist as well as specially trained nursing staff.
  - The procedure is carried out using local anesthesia and is absolutely painless during the operation and post-operative stage.
- New hair develops gradually after the hair transplant and positive consequences can be seen after about 3 months, while a complete result can be observed usually a year after the operation.
  - New hair grows like the rest and requires the usual care (shower, hairdo etc.). Their genetic predisposition further ensures that they are not affected by hair loss, eliminating any chance of hair loss in those areas.
- Depending on their profession, habits and lifestyle, the person undergoing hair transplantation returns to normal life after a few days (in some cases the person can go back to work even the next day). The restrictions apply mainly on weightlifting, sun exposure, intense physical exercise etc...
